# WEATHER SYNOPSIS BY REGION

## **NORTHERN CALIFORNIA**

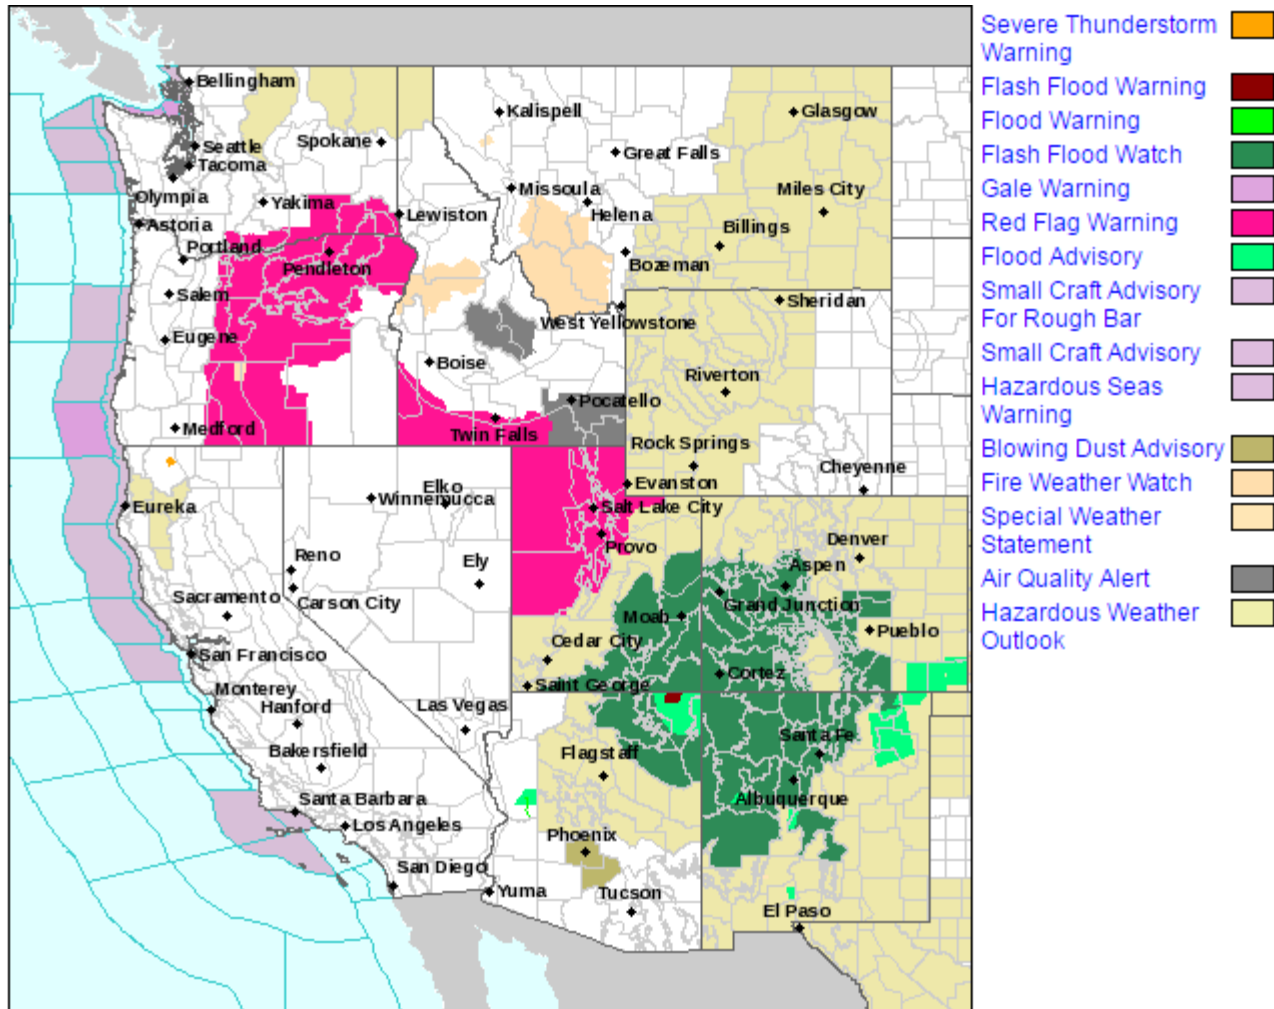

High Risk for isolated afternoon/evening thunderstorms in the northern areas today and Saturday. Isolated afternoon/evening mountain thunderstorms also possible Saturday far NE portion of Mid Coast PSA in the greater Alder Springs area. Some form of a low pressure trough with small weather disturbances periodically rotating around it will govern our weather for the next 7 days. Isolated late afternoon and evening thunderstorms are expected to develop today and Saturday in our northern areas. Any lightning today will be mostly dry, then probably a mix of wet and dry Saturday. The High Risk category of Significant Fire Potential in place today and Saturday for the NW Mountains and NE PSA's is for lightning. Mountain thunderstorms may also occur Saturday in the far NE corner of the Mid Coast PSA and could bring High Risk to that small area as well, but the vast majority of that PSA will not see lightning. Some showers and a few thunderstorms may become possible Wednesday as a bit stronger weather system arrives over the region, otherwise seasonably sunny skies will prevail through next week. The marine layer has become quite deep (around 2500-3000 ft) and morning low cloudiness has pushed quite a bit further inland than the past few days, especially through The Delta into the southern Sacramento Valley this morning. That may happen again tonight as well. Cooler temperatures and somewhat stronger than normal gusty afternoon winds can be expected in The Delta over the next few days under the deeper marine layer too. Persistent low clouds and patchy fog will likely continue near the coast next week as well, although the stronger low the middle of next week may mix up the marine layer enough to minimize coastal low cloudiness for a time. In general, temperatures will be near to somewhat below normal, and winds will generally be of local diurnal patterns for the next 7 days.

## **SOUTHERN CALIFORNIA**

A stationary low pressure area near Vancouver will shepherd several weak troughs into the area, resulting in onshore flow, a deep marine layer and breezy conditions in and near the deserts. Southwesterly winds aloft are expected to push most of the monsoonal moisture east of the area. Only a few thunderstorms can be expected in the northern and eastern sections of the Mojave National Preserve today. But after today, no thunderstorms are expected during the period. High temperatures will cool off a couple degrees today, then will hold steady through early next week. Expect seasonably warm temperatures with highs in the 70s along the coast and in the mountains above 6,000 feet, lower 90s in the valleys and highs of 100-105 in the desert. Minimum RH will remain above 25% outside the desert today, but this weekend, the mid layers of the atmosphere will turn drier. Areas above and inland from the marine layer will see daily minimum RH in the teens from 2,000 feet to 6,000 feet. Recovery should be good each night. West winds of 15-25 mph with gusts to 45 mph will develop this afternoon in and near the Antelope Valley, the Banning Pass and the eastern Cleveland National Forest. Expect slightly weaker winds in these areas during the weekend, but a deeper trough may cause winds to increase once again Tuesday. All precipitation associated with this trough will remain well north of the district. Long range models indicate some monsoonal moisture may return the weekend of the 13th, or possibly the following week.
